

Abstract

Foodstuffs packaging (1) having a bottom part (2), which has at least one row of shaped depressions (21) for accommodating separate articles, in particular eggs, and having a lid part (3), which is arranged for swing action on the bottom part (2) and, in the closed state, bounds an interior together with the bottom part, the lid part (3) having a trough (4) which is open in the upward direction, and, according to the invention, a covering means (7) is provided and closes off the trough (4) in the upward direction. This produces an accommodating space (40) into which items can be inserted. Expediently provided are additional retaining depressions (36), which are connected to one another by the trough (4). It is possible for the retaining depressions (36) to be designed as clamping openings (6) and to interact with clamping elevations (5) on the underside of the shaped depressions (21) of another foodstuffs packaging unit.
